

License To Chill

COOL OPERATION FOR HORSEPOWER PRODUCTION

Text and photography by Ricardo Topete

Mustang enthusiasts know cold air will yield more horsepower and torque than hot air. The colder the air being fed into an engine, the denser it will be, thereby allowing more oxygen to be ingested. More air equals more power. In a quest for colder air and more power, many hot-rodders have successfully used cold air kits, intercoolers, and even nitrous oxide to cool down the air charge entering the motor. A horsepower producer gaining popularity among performance buffs is carbon dioxide, also known as CO₂.

I won't bore you with the science behind CO₂, but I must point out how CO₂ can help horsepower junkies like us. In a nutshell, CO₂ has cryogenic (freezing) properties to greatly reduce temperatures. We simply approach an old concept from a new angle by cooling down an engine's air intake by using S-Max's Chill Zone CO₂ kit & Ice Tube.

S-Max has forged a strong following in the sport-compact world and began experimenting with CO₂ in an effort to further reduce inlet air temperatures on turbo/supercharged vehicles. The end result was their Chill-Zone CO₂ kit and Ice Tube.

The Chill Zone CO₂ kit is a complete system developed specifically for automotive use. The kit includes a 10-pound bottle, mounting brackets, steel braided lines, solenoid, switches, and wiring (nearly the same components included in a modern day nitrous kit). The CO₂ can be purchased at many welding supply stores, paintball supply shops, and many gas stations; making CO₂ fairly accessible. We paid \$1.40/lb. for CO₂, which translates into \$14 per tank. Compare that to nitrous oxide, which typically sells for around \$5.00/lb. or \$50 per tank.

To complement the Chill Zone CO₂ kit,

S-Max also created the Ice Tube. The Ice Tube installs in the air intake tract before the throttle body and gets a charge of CO₂ pumped into it, thereby allowing the air charge to get "chilled" as it passes through the Ice Tube. Think of the Ice Tube as a tube within a tube. It measures four inches outside diameter, but three inches for the inside diameter (where the intake charge travels through). The resulting one-inch chamber created between the inside and outside tube has a coiled tube that wraps itself within those walls.

When the CO₂ is sprayed, it travels through the coiled tube inside the Ice Tube and freezes the Ice Tube from within. As the intake air charge passes through the Ice Tube, heat is removed, courtesy of the CO₂, which results in a colder, denser air charge. This process yields more power and torque.

Since the Chill Zone CO₂ kit and a nitrous kit are similar in contents and operation, the installation procedure is also similar. Anyone with nitrous experience will feel

1 Similar to a nitrous system, the Chill Zone CO₂ kit can bring added horsepower.

2 The Ice Tube provides an integral part of the cooling process

3 The view of inside of the Ice Tube reveals the “tube within a tube” concept.

comfortable with this system. The major difference between a nitrous kit and a CO₂ kit is that, unlike nitrous, CO₂ does not get drawn *into* the engine. The CO₂ gets discharged/vented into the atmosphere as it exits the Ice Tube. This creates an inherent safety benefit since no foreign chemicals are pumped into the engine. Instead, the engine consumes

4 Here’s a better look at what’s going on. The outside diameter is four inches while the inside diameter is only three.

5 Now is time to get down to the business at hand and it should be fairly straightforward.

6 Begin by removing the discharge tube

a burst of cold, dense air. Furthermore, CO₂ must be discharged away from an engine’s air tract because CO₂ is inert, or non-flammable. If CO₂ were to get sucked into the air stream of a motor, it would *reduce* power output.

The Mustang gurus at GTR High Performance performed all the testing and installation. In a matter of a few hours,

between the supercharger and throttle body.

7 Removing the strut tower brace allowed for more room under the hood.

8 Next, trial fit the Ice Tube in place of the discharge tube and snug hose clamps.

the CO₂ kit and Ice Tube were installed in a 2001 Mustang GT. This Mustang is no stranger to the dyno, serving as a GTR workhorse (pun definitely intended). Nicely equipped with a Paxton NOVI 1000 supercharger kit (6psi), and a few bolt-ons, we figured this car would make a good candidate and be fairly typical of what the average Mustang enthusiast owns. In

9 Measure and mark the amount needed to be trimmed from the discharge tube.

10 Carefully cut off the required amount.

addition, since this was not an intercooled supercharger kit, our theory was that it would react well to the freezing effect provided by CO₂.

By now, some of you have already jumped ahead to the dyno test results. For the few who bothered to read the article, a quick note about our testing procedures, which were done to ensure consistency and accuracy. No tuning or adjustments were done; no “doctoring”

the dyno runs. The air/fuel ratio and ignition timing were locked to avoid skewing the numbers. This would allow the merits of the CO₂ to be displayed with no extra help. In other words, how much power can we gain simply by cooling down the air charge with CO₂?

To establish a baseline, we did five back-to-back runs without the CO₂ spray. The Mustang was brought to normal engine operating temperature for every run.

Typical of non-intercooled supercharged cars, we noticed a fair amount of hp/torque drop after every dyno run, simply due to heat soak. A close look at the first and coldest dyno run of the day revealed the highest power output, with 282 hp @ 5,200 rpm, 312 lb-ft of torque @ 4,200 rpm, and just a tick over 6 psi boost at 5,700 rpm. Comparing the cold run to the hot, heat-soaked dyno run and the performance drop became clear. Peak numbers of 274 hp @ 5,400 rpm and 301 lb-ft of torque @ 4,200 rpm show the impact of heat. Within a few dyno pulls, the GT dropped 8 hp and 11 lb-ft of torque.

Next, we began to play with the spray. For consistency, the Mustang was brought up to the same operating temperature as all previous dyno runs. No cool-down was allowed, other than what the CO₂ delivered. We experimented a bit with how and when to spray the CO₂. In the end, we found best results by blasting the Ice Tube with CO₂ for five seconds with the engine idling, then allowing the motor to idle for a couple of minutes, and then blasting the CO₂ for another five seconds immediately before the dyno run.

When your Mustang is in the stable.

Before your Mustang goes into storage, make sure STA-BIL® Fuel Stabilizer goes in first. Without STA-BIL, gas turns stale in just 60 days. Gum forms and engines won't start. But STA-BIL keeps fuel fresh for over a year. So your engine starts quick and easy. And if you drive infrequently, add STA-BIL with every fill-up.

When you store, start with STA-BIL®

Faster Delivery- The Digital Edition of *Mustang Enthusiast* is available the same day the Print Edition mails. No waiting on postal delivery!

Search Capabilities- Just enter a keyword and you'll receive a list of pages with search results highlighted. You can search the current issue or the last three digital back issues of *Mustang Enthusiast*.

Print articles- Need a paper copy? Print one page or a range of pages to take with you anywhere you go!

TECHNICAL License to Chill

11 Install the Ice Tube and secure it to the modified discharge tube.

12 The ideal spot to mount the CO₂ bottle is the trunk. We chose to mount it just behind the rear seat to maximize trunk space.

13 Take note of what is under the floorboard as you are drilling.

14 Mount and secure the bottle brackets to the floorboard.

15 Conveniently, '94-'04 Mustangs have a

factory hole on the passenger side of the trunk floor. That's where we ran the CO₂ line. Reuse the factory rubber grommet to insulate the CO₂ line.

16 Pull the CO₂ through the factory hole in the floor and route towards the front of the car.

Legend Mustangs by Temple Performance Cars

Series 1 and Series 2

New Ford Mustang GT with client's choice of factory Ford colors
 Client chooses colors for painted body and rocker stripes
 Complete Legend body package, Performance 1.0 springs • Billet interior accent package
 Carroll Shelby 20X9 and 20X10 wheels with BFG 255/35-20 and 285/30-20 tires

The Series 1 includes everything above plus:
 A choice of Roush supercharger system with 450hp and full warranty
 or a ProCharger system rated at 500hp & Boost and air/fuel gauges
 – Optional chassis package for convertibles

Custom-built racing-style sculptured leather seats with all power options by Temple Performance Cars

23 For testing purposes, we routed the CO₂ purge line up and away from the engine. We will find a more permanent location at a later time.

24 We routed the wire for the solenoid through a grommet on the driver side firewall and connected it to the arming switch in the interior of the car.

25 Here's the line graph of the dyno results. Horsepower and torque gains were evident, proving this to be an economical means to gain power.

ENGINEERED AND BUILT IN THE U.S.A.

GRIP²

The **SPEC SUPER TWIN** Clutch and Flywheel assembly delivers the perfect fusion of performance and drivability, offering amazing holding power with smooth engagement and quiet operation, thanks to its all-billet construction.

The Super Twin features full-faced carbon graphite discs as one of four compound options and harnesses up to 1750 ft. lbs. of torque, elevating your car to performance levels you have to experience to believe.

Visit us at SEMA booth # 24706

AMAZING TORQUE CAPACITIES | EXCELLENT DRIVEABILITY | THOUSANDS OF APPLICATIONS
SPECCLUTCH.COM 800.828.4379

SPEC
 SHIFT TO A HIGHER STANDARD.

Blasting the Ice Tube twice and allowing for a couple of minutes in between blasts allows the Ice Tube to "cold-soak". In a drag-racing situation this would translate into spraying CO₂ before the burnout is done and then again just before the car is staged and ready to launch.

Studying the results of the CO₂-assisted dyno run is eye opening. Peak figures jumped to 302 hp @ 5,400 rpm, 331 lb-ft of torque @ 4,300 rpm, and 6.26 psi boost @ 5,700 rpm. A closer look between the runs with and without CO₂ paints a more impressive picture. For instance, compare the first (coldest) dyno run without the CO₂ to the dyno-run with the CO₂ spray. Peak gains checked in at 23.54 hp and 25.44 lb-ft of torque. Further examination reveals that over 10 hp is available from 3,300 rpm on and more than 10 more lb-ft torque is on tap from an early 2,700 rpm until the end of the run. As notable as these results are, even more impressive is the comparison of the hot dyno run without CO₂ to the dyno run with the CO₂. Peak gains jumped to 30.2 hp and 33.2 lb-ft of torque! There were increases of over 10 hp from 2,800 rpm and over 20 hp from 3,800 rpm until the

end of the run. Torque is improved by more than 14 lb-ft the moment the loud pedal is buried.

Clearly, the CO₂ delivers large doses of power throughout the entire rpm range, not just at the top of the tach. On a road test, this translated into an extra shot of oats to the Mustang the moment the hammer was dropped. The newfound power delivered a satisfying sensation, allowing the Mustang to pull harder, quicker and longer before power dropped off. Essentially, the Chill Zone CO₂ and Ice Tube kit provide a poor-man's intercooler by allowing substantially lower air temps to produce more power and torque.

The Chill Zone and Ice Tube can also be used in a naturally-aspirated vehicle. We would wager the results would be less than that of a supercharged/turbocharged vehicle. It would also be interesting to see the effects of CO₂ on a higher output supercharger kit, say 10-12 psi, or better yet, one already equipped with an intercooler. Based on our findings, we would speculate that a higher output blower kit would show larger power gains as they generate higher inlet air temperatures and, as a result, would react

favorably to the freezing effect.

Space would be the only limiting factor for this system. You need sufficient room to mount the Ice Tube before the throttle body. With an overall length of 9¾ inches, the Ice Tube may pose a fitment issue on some crowded engine compartments. In our GT, it fit beautifully...kudos to the staff at GTR for a job well done.

As is the case in the automotive performance world, speed costs money. However, you will be glad to know that the price of admission for the Chill Zone and Ice Tube kits is reasonable. GTR sells the Chill Zone kit for just under \$400 and the Ice Tube comes in at about \$250. Factor in less than \$15 for a 10 lb. fill up and you are ready for action. ■
